

ONE-PAGE OPERATING PLAN

How I'd Start AI Enablement at Story

A 30-day, operator-led approach to make AI useful inside regulated cannabis workflows.

Premise: Story does not need AI for its own sake. It needs a repeatable operating loop: find friction, pilot practical workflows, train teams safely, and measure whether adoption improves speed, visibility, consistency, and execution.

FIRST 30 DAYS

1. LISTEN AND MAP	Interview operators, department leads, and frontline users. Find work that is delayed, duplicated, re-keyed, or trapped in people's heads.
2. RANK THE RIGHT TARGETS	Score opportunities by friction, adoption likelihood, risk, data readiness, manager support, and measurable operational lift.
3. PILOT NARROW WORKFLOWS	Start with 2-3 low-risk, high-visibility pilots: SOP retrieval, exception intake, training support, or weekly ops follow-up.
4. TRAIN AND MEASURE	Create job aids, manager review gates, and simple scorecards for usage, time saved, fewer escalations, and reduced rework.

WHERE I'D LOOK FIRST

SOP + TRAINING SUPPORT	Help teams answer 'how do I do this?' faster while keeping policy, compliance, and manager review intact.
EXCEPTIONS + COMPLIANCE	Turn recurring edge cases into checklists, intake paths, and documentation that reduce back-and-forth.
OPS HANDOFFS	Surface where retail, cultivation, production, inventory, vendors, and finance lose visibility or duplicate work.
REPORTING + FOLLOW-UP	Tighten weekly operating rhythms: action items, vendor follow-up, invoice issues, and team accountability.

GUARDRAILS

WORKFLOW FIRST Pick business friction before picking tools.	HUMAN REVIEW Keep judgment, compliance, cash, and personnel decisions in the loop.	ADOPTION PROOF Document what works, train repeatably, and measure impact weekly.
---	--	--

WHY THIS IS A CREDIBLE FIRST MOTION

My edge is practical: cannabis operator judgment plus hands-on AI systems work. I understand regulated operations, finance pressure, training gaps, adoption friction, and how to translate executive intent into tools teams can actually use.

The goal is not to make Story 'use AI.' The goal is to make Story faster, clearer, and easier to operate.
